Please describe CyQu's security monitoring capabilities, including whether a Security Operations Center (SOC) is in place for continuous threat detection and incident response.

CyQu is monitored by Aon's cybersecurity operations through their AC3 team (Aon Cybersecurity Command Center), which functions as SOC equivalent.

The CyQu application, which is hosted in AWS, benefits from both Aon's internal monitoring capabilities through the AC3 team and AWS's ISO certification and SOC 2 compliance. Aon has a Security Monitoring Standard in place and provides 24x7x365 logging and monitoring services for security and audit logs coming from Infrastructure, OS/Compute and Security Systems. LogScale serves as Aon's global SIEM solution to aggregate and correlate logs from critical systems and perform analysis for incident management, with SIEM alerts investigated by the AC3 team (Aon Cybersecurity Command Center). While Aon does not have a formal SOC report nor ISO certification, the company maintains a comprehensive security and privacy program based on ISO 27002, NIST and Department of Defense frameworks, with policies designed to address protections found in existing laws and regulations.

Does the software requires cookies, what are they used for?

CyQu application does not implement cookies for tracking or analytics purposes. The only cookies present are those automatically managed by our third-party services: Auth0 (for secure authentication and session management) and Sentry (error monitoring). These cookies are essential for application functionality, implement security best practices, contain no personally identifiable information beyond what's necessary for authentication, and are automatically removed upon logout or session expiration. All cookie usage is limited to security and operational requirements only.
